

Cascade Δ features (radiation-phase dynamics)

Headline pair (manuscript-quoted)
DSB repair $\times$ Δ CD8-cytotoxic
 $r = -0.07$, $P = 0.83$ ($n = 12$)
[not in this 4-cascade panel;
see Supp Fig S20A forest]

Cell value = plain Spearman r ; BH-corrected across 36 pairs. P value shown for cells with $P < 0.10$. * nominal $P < 0.05$ ** BH $q < 0.05$.

0/36 nominal $P < 0.05$ · 0/36 BH $q < 0.05$ (no individual baseline-cascade pair detected).

See Supp Fig S12 for omnibus block-wise sign-coherence test (12/12 cells in predicted direction, $P = 2.4 \times 10^{-4}$). See Supp Fig S11 for partial-Spearman sensitivity (response-group adjusted).
