

Cascade Δ features (radiation-phase dynamics)

n = 10–14 paired subjects (varies by cascade Δ type) · plain Spearman ρ (manuscript-quoted convention) · BH-corrected across 36 pairs

Cell value = plain Spearman r; small n=... in lower-right corner of each cell. * nominal $P < 0.05$ ** BH $q < 0.05$.

Convergence result: 0/36 plain $P < 0.05$ · 0/36 BH $q < 0.05$ (static and dynamic layers observationally independent).
