

Cascade Δ features (radiation-phase dynamics)

n = 10–14 paired subjects (varies by cascade Δ type) · partial Spearman ρ (response-group-adjusted; manuscript-consistent) · BH-corrected across 36 pairs (4 user-specified cascades)
 Cell value = partial Spearman r; small n=... in lower-right corner of each cell. * nominal P < 0.05 ** BH q < 0.05. 5th column (grey header) shown for headline-pair cross-reference; outside the 36-pair test.

Convergence result: 0/36 partial P < 0.05 · 0/36 BH q < 0.05 (baseline level and radiation-phase dynamics statistically independent).
