

n = 10–14 paired subjects · plain Spearman ρ (NO group adjustment — diagnostic only) · BH-corrected across 36 pairs

Cell value = plain Spearman r. * nominal $P < 0.05$ ** BH $q < 0.05$. Gold border = manuscript headline pair (DSB $\times$ Δ CD8-cytotoxic, plain $r = -0.07$).

Diagnostic result: 0/36 plain $P < 0.05$ · 0/36 BH $q < 0.05$ (top 2 cells $P = 0.0586, 0.0588$ just above the threshold).
