

Supp Fig S25. Inflamed-but-Ineffective (IBI, n=3 bad) vs Inflamed-Active-Effective (IAE, n=2 good)

IAE = subjects 2, 4 (inflamed good pCR). IBI = subjects 10, 11, 13 (inflamed bad poor).

*Inflamed = Δ Ayers TIS > 0 (regulatory-grade post-RT). IAE productive cascade (TCR $\rightarrow$ JAK-STAT $\rightarrow$ NF- κ B $\rightarrow$ BATF $\rightarrow$ TAPBP)
vs IBI naive-B / NK-inhibitory / ARG2-suppression without productive signalling.*

A Composite-level IAE vs IBI fingerprint

Top 16 composites / ratios by $|IAE - IBI|$. Positive (teal) = $IAE > IBI$; negative (coral) = $IBI > IAE$.

B Gene-level top 24 discriminators

IAE productive: PLA2G6, JAK3, IKBKB, TAPBP, ZAP70, IFIH1, STAT6, PYCARD, BATF, LAG3, TLR8. IBI unproductive: KIR_Inh_Subgroup_2, ARG2, RAG1, MS4A1, XCL2.
