

Supp Fig S28. NanoString vs RNA-seq platform concordance

*Per-gene Pearson correlation of NanoString Δ $\times$ RNA-seq Δ across 5 subjects (s2/4/14/10/13; subj 11 RNA-seq pre missing).
694 expressed shared genes. Median $r = +0.754$. 90.1 % of genes $r > 0$.*

Rules out platform artefact as explanation for the direction flip seen in the pre-spec Δ analysis.

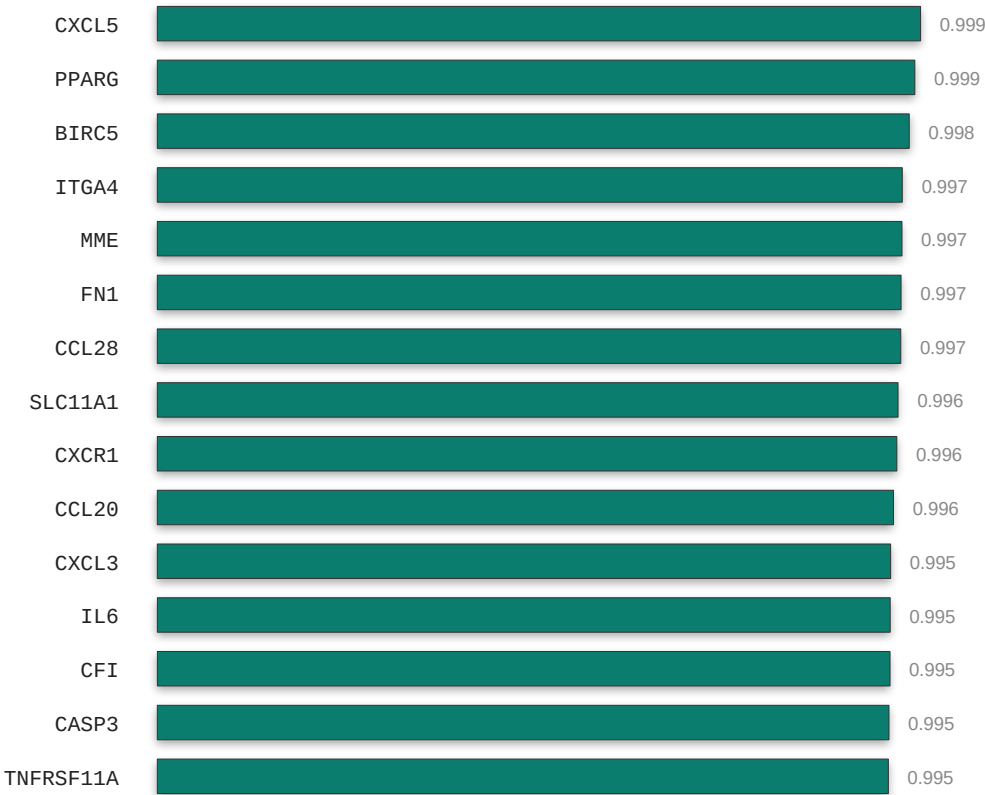

A Histogram of NanoString $\Delta \times$ RNA-seq Δ Pearson r (n = 694 genes)

Median $r = +0.754$. Gold dashed line = median.

B Top 15 concordant genes by Pearson r

Gene-level NanoString Δ and RNA-seq Δ agree for top cytokines, Ig markers, cell-cycle markers (BIRC5), and chemokines (CXCL5, CXCL3, CCL20).

Pearson r (zoomed to 0.9–1.0)
