

A

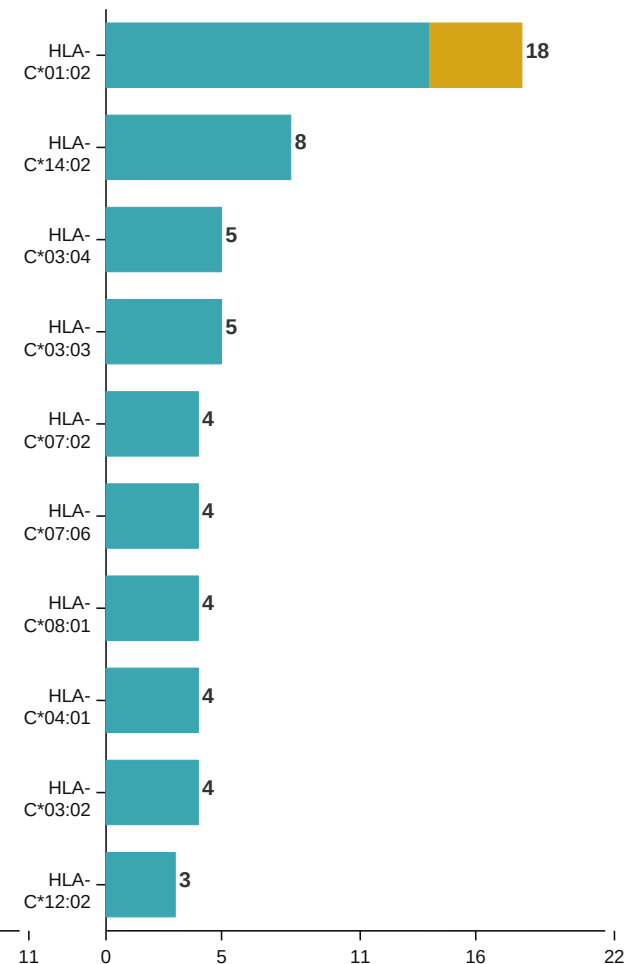

HLA-A (top 10)

HLA-B (top 10)

HLA-C (top 10)

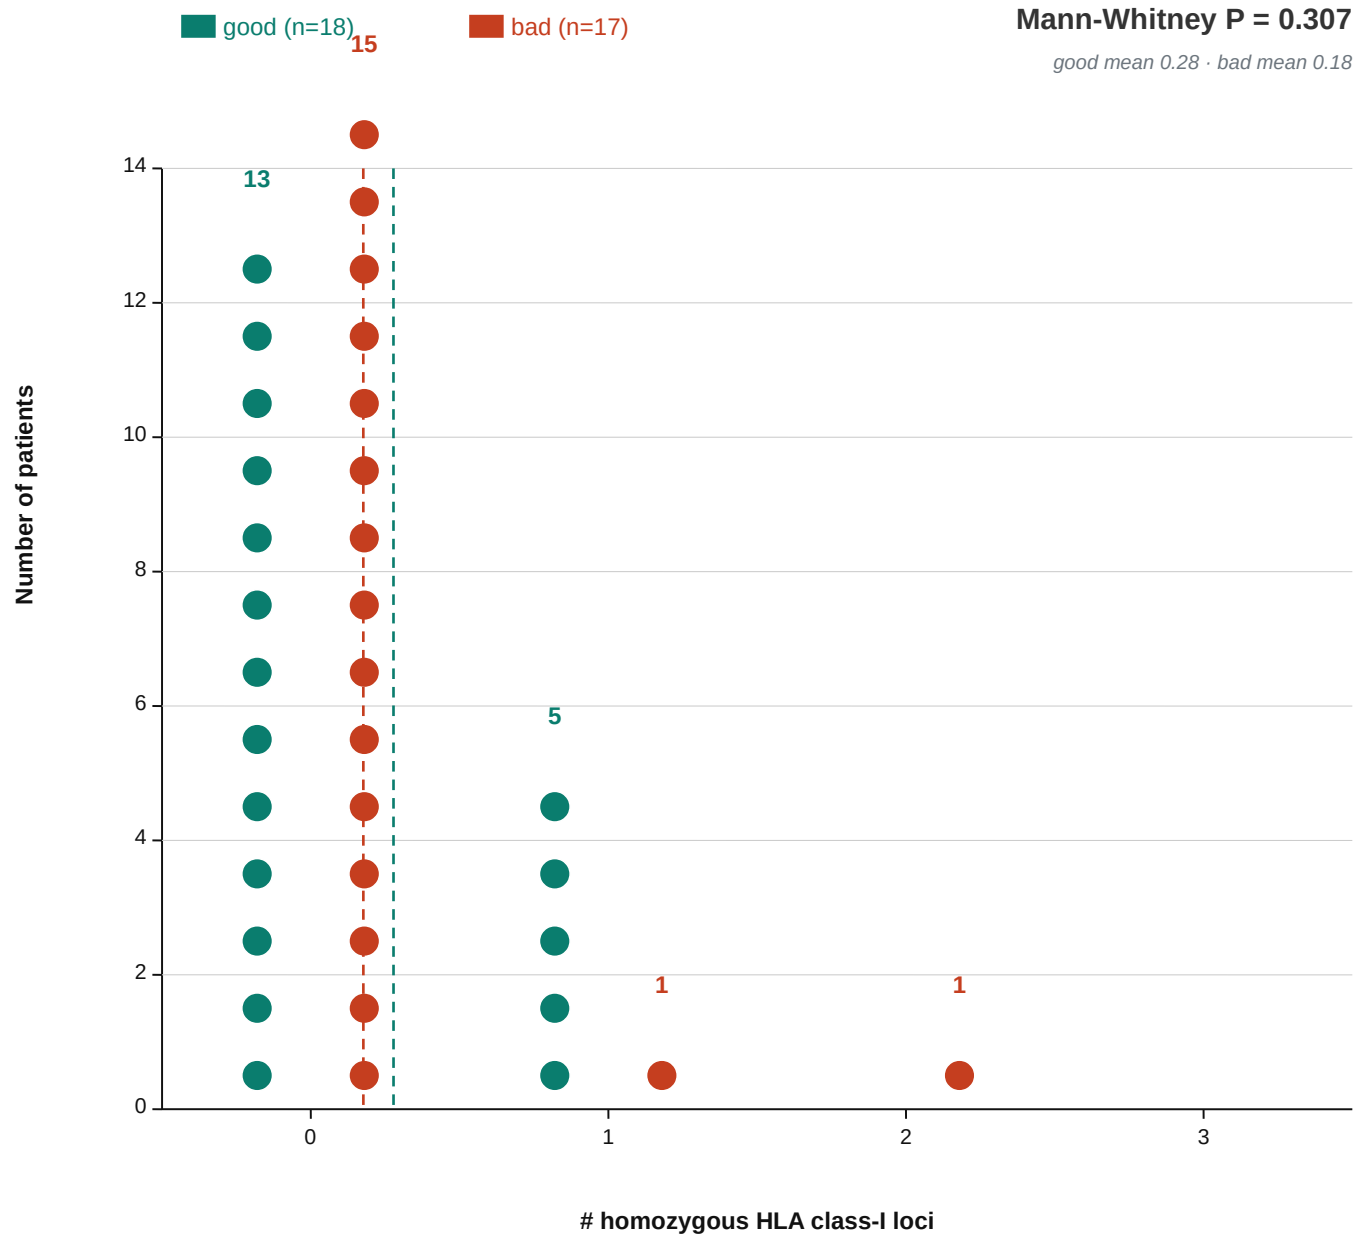

Allele count (2 × n_patients)

Allele count (2 × n_patients)

Allele count (2 × n_patients)

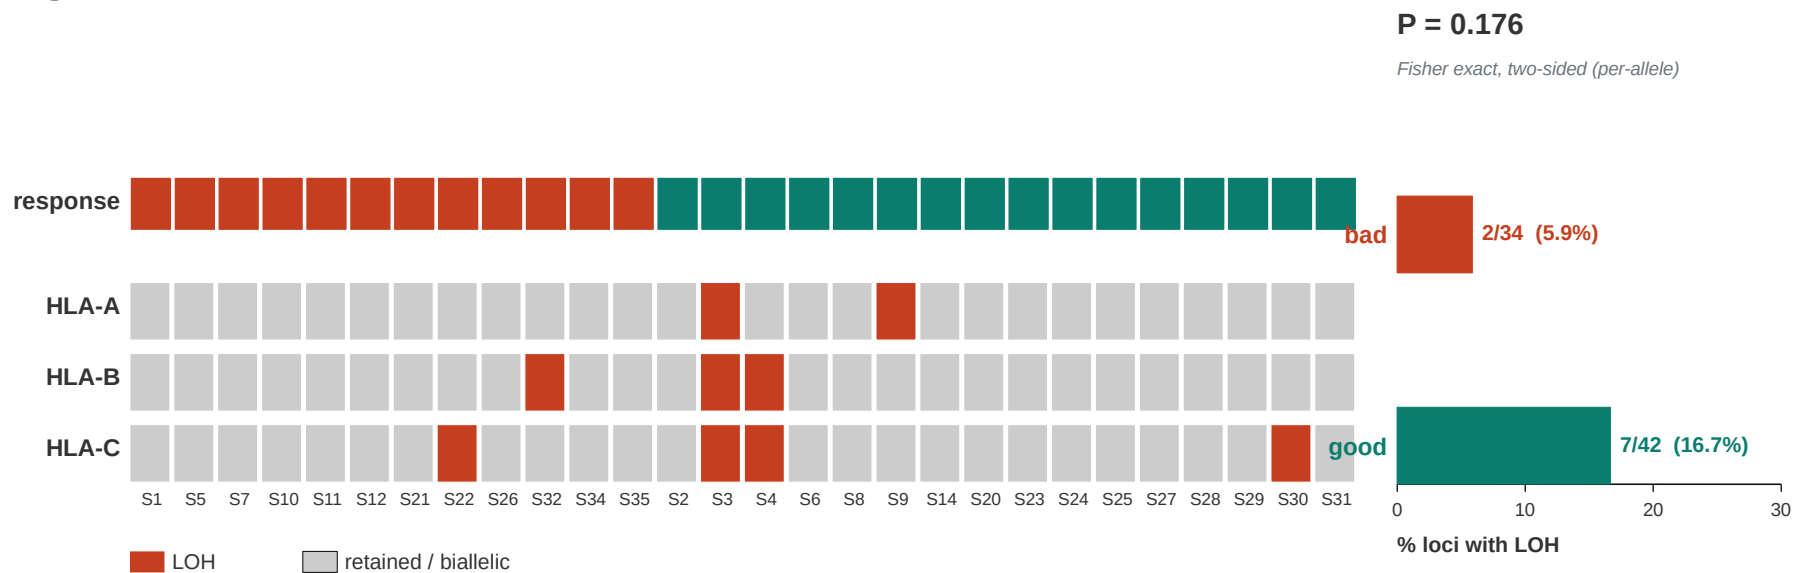

Allele counts per locus (2 alleles/patient); stacked yellow = contributed by homozygous genotype. n=35 patients (full v2 cohort).

B

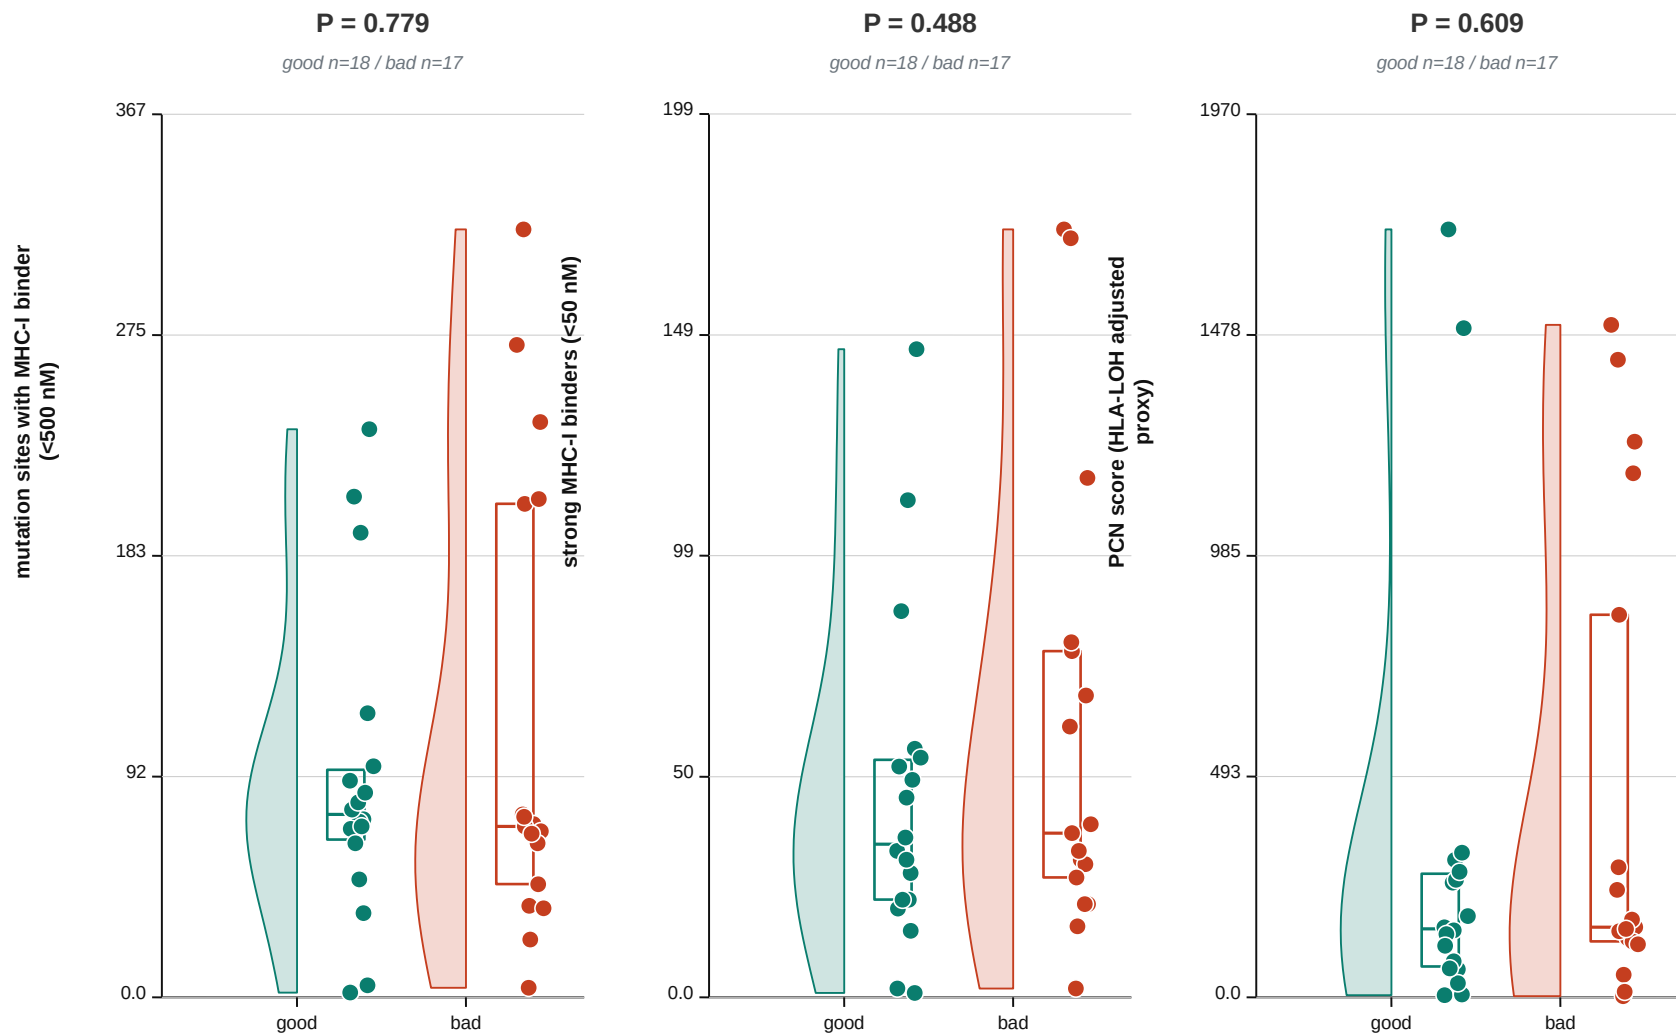

Each dot = one patient. v2 full cohort n=35 (good 18 / bad 17). Dashed lines = per-group mean.

C

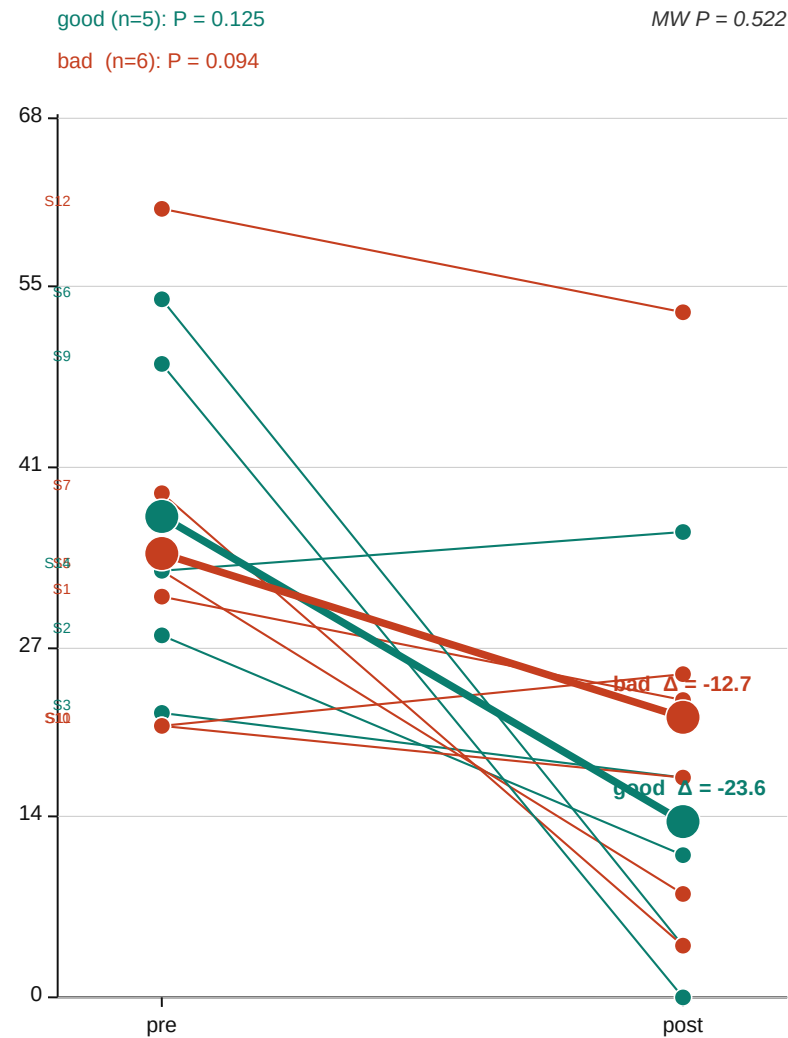

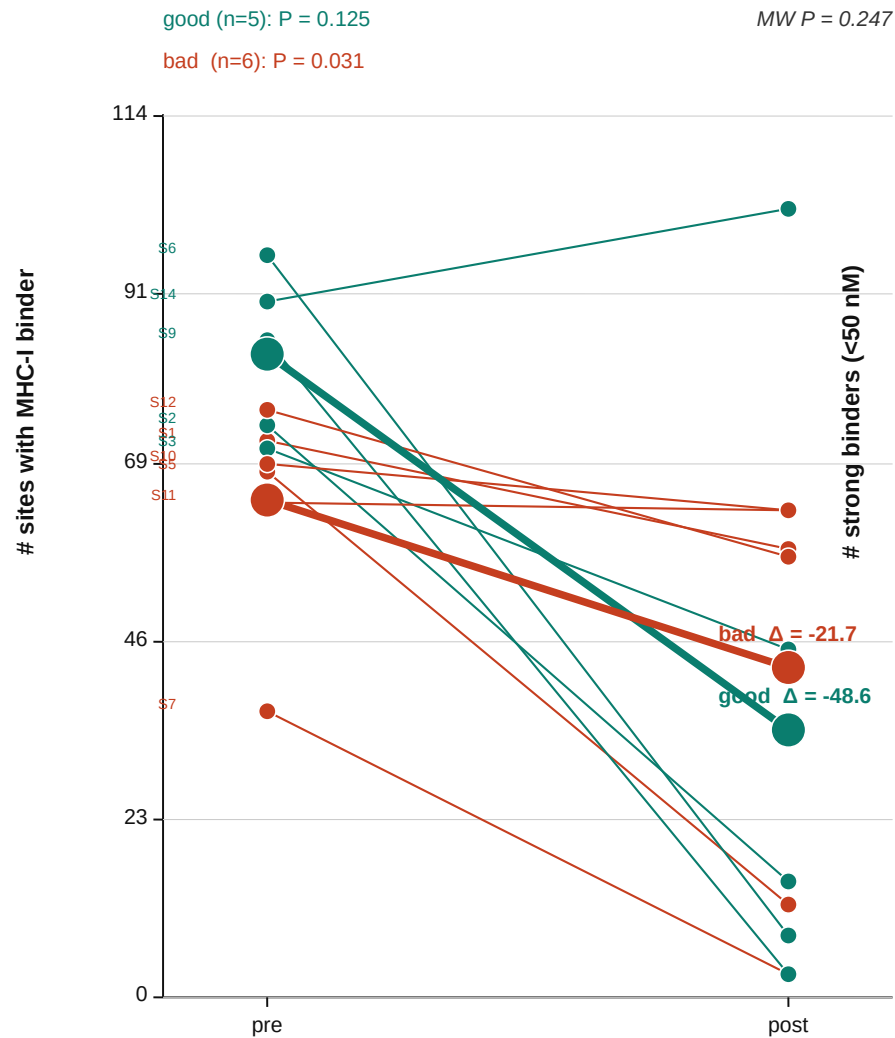

Per-allele Fisher (LOHHLA-lite): good 7/42 vs bad 2/34, P = 0.176. Heatmap rows = HLA-A/B/C per patient (het normal only). Grey = retained or non-het.

D

Half-violin = kernel density, open box = IQR with median line, jittered points = individual pre-CRT tumors. v2 full cohort (n=35).

E

Per-subject thin lines, group-mean thick line. Wilcoxon signed-rank within each group; Mann-Whitney U between groups. N=11 paired subjects (good 5, bad 6; subj 13 excluded).

F
